

Autonomous Claims Orchestrator - Executive Workflow Overview

Stakeholder-focused summary with architecture and business flow.

System Footprint

- 8 backend microservices covering ingestion, FAQ, extraction, decisioning, orchestration, dashboarding, and notifications.
- 2 foundational modules: API gateway and shared configuration.
- Core data zones: ingested claims, processed claims, and FAQ/knowledge sources.

Architecture Diagram

Legend: Automated flow | Decision support | Customer communication

Business Workflow

- Intake: incoming messages are synchronized and parsed.
- Triage: FAQ/customer-data inquiries are diverted for auto-response.
- Registration: valid FNOL claims are persisted with attachment traceability.
- Automation: orchestrator invokes extraction and policy-grounded decision support.
- Visibility: processed outputs power dashboards and operations handling.
- Communication: customer notifications are sent at key lifecycle milestones.

Stakeholder KPI Set

- Claims ingested vs processed throughput
- FAQ deflection and automation rate
- Average processing turnaround time
- Coverage-validation and decision quality signals
- Customer communication timeliness
